

1. Reaction for the combustion of methane in a bunsen burner:

- What is the formula for methane: _____
- Write a balanced rxn for the combustion of methane, including subscripts.
- Draw the Lewis Dot structures of all reactant and product molecules.
- This rxn releases 802 kiloJoules of energy per mole of methane burned.
Write the heat term into the equation on the correct side.
- Is this reaction exothermic or endothermic? _____
- Sketch an energy diagram for this reaction and label it.
- What is ΔH for this reaction? $\Delta H_{\text{rxn}} =$ _____

Rxn: _____

2. Demo: Examples of endothermic/exothermic reactions:

Is the above reaction exothermic or endothermic? _____

What is the value for ΔH_{rxn} ? _____

If the reaction is done in a test tube, will the glass get hotter or colder? _____

Sketch an energy diagram for this reaction. Label the ΔH and the activation energy.

Is the above "reaction" exothermic or endothermic? _____

What is the value for ΔH_{rxn} ? _____

If the reaction is done in a test tube, will the glass get hotter or colder? _____

Sketch an energy diagram for this reaction. Label the ΔH and the activation energy.

a. What is the value for ΔH_{rxn} , including the sign? _____

b. List some possible conversion factors for the above reaction.

c. What mass of oxygen is needed to react completely with 10.0 grams of ethane?

d. If 1 pound (454 grams) of ethane are react, what mass of carbon dioxide will be produced?

e. If 1 pound (454 grams) of ethane react, how much energy will be released?

f. If 4.08×10^{22} molecules of oxygen react, how much energy will be released?

g. How many grams of oxygen gas must react in order to produce 950. kiloJoules?

a. Is this reaction endothermic or exothermic (which one)? _____

b. What is the value for ΔH_{rxn} , including the sign? _____

c. How much energy (in kJ) is needed to separate 1.00 gram of water into its elements in the above reaction?

d. What mass of oxygen gas can be produced if 500. kJ are available?

a. If 0.400 grams of magnesium powder are burned, how much energy (in kilocalories) will be released?

b. What mass magnesium powder must be burned in order to produce 100. kcal?

c. If 3.00 moles of oxygen gas react, what mass of magnesium oxide should form?
